component, or an antibody or antibody fragment that binds to an amyloid component, or an antibody or antibody fragment that binds to an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity of at least cour times a base line serum immunoreactivity control level indicates a prognosis of improved status with respect to the disorder. The pharmaceutical compositions of the invention are useful for treating a control beta peptide fabril deposition in a patient. Such disorders include Alzheimer's disease characterised by amyloid beta peptide fibril deposits; type 2 diabetes characterised by islet amyloid protein peptide (IAPP, amylin) fibrils; reactive systemic amyloidosis associated with systemic inflammatory diseases (e.g., amyloidosis and familial amyloid ardiomyopathy characterised by ATTR charits derived from serum amyloid A protein (ApoSSA)); systemic senile control arthritis, characterised by ATTR chirils derived from serum amyloid ardiomyopathy characterised by ATTR chirils derived from transthyretin (TTR); transmissbile spongiform encephalopathies (e.g. Creutzfeld-Jakob disease, Kurul characterised by prion protein deposits; and beta-2-microglobulin deposits which form as result of long term haemodialysis treatment. The present sequence represents an immunogenic fusion protein comprising an amyloid beta peptide fused to a universal T-cell epitope which may be used in a composition to treat or prevont Alzheimer's disease. Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.

Disclosure; Page 31; 143pp; English

This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the Drain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Fc receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have noctropic and neuroprotective activity. The method is also useful for monitoring a course of treatment methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease

Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.

Disclosure; SEQ ID NO 35; 78pp; English.

The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-symuclain aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-symuclain and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-symuclain aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-symuclain and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-symuclein or Abeta

The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a selected amyloid component. A patient serum immunoreactivity of at least four times a base line serum immunoreactivity or at least four times a compositions of the invention are useful for treating a pharmaceutical compositions of the invention are useful for treating a wide variety of disorders characterised by amyloid fibril deposition in a patient. Such disorders include Alzheimer's disease characterised by
is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                        Amyloid disease, amyloid fibril deposition, amyloid plaque; immunogenic; antibody, vaccine, Alzheimer's disease; type 2 diabetes; reactive system amyloidosis; systemic senile amyloidosis; familial amyloid cardiomyopathy; transmissible spongiform encephalopathy; cretuzfeld-Jakob disease; Kuru; haemodialysis-asssociated beta-2-microglobulin deposition; amyloid beta peptide; universal T-cell epitope; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition comprising immunogen against amyloid component such as fibril peptide or protein, or antibody against amyloid component useful for treating amyloid diseases or amyloidoses.

The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
amyloid beta peptide fibril deposits; type 2 diabetes characterised by islet amyloid protein peptide (IAPP, amylin) fibrils; reactive systemic amyloidosis associated with systemic inflammatory diseases (e.g., rheumatoid arthritis, osteomyleitis, tuberculosis) characterised by An fibrils derived from serum amyloid A protein (ApoSSA); systemic senile amyloidosis and familial amyloid cardiomypathy characterised by ATTR fibrils derived from transthyretin (TTR); transmissible spongiform encephalopathies (e.g. Creutzfeld-Jakob disease, Kuru) characterised by prion protein deposits, and beta-2-microslobulin deposits which form as result of long term haemodialysis treatment. The present sequence represents an immunogenic fusion protein comprising an amyloid beta poptide fused to a universal T-cell epitope which may be used in a composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.

                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or

Novel synthetic immunogen for inducing immune response against gonadotropin releasing hormone, comprises fusion peptide having promiscuous helper T-cell peptide epitope and immunomimic peptide epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antibodies against gonadotropin releasing hormone (GnRH also known as luteinishing hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer),
                                                                                                          Gonadotrophin releasing hormone, GnRH; synthetic immunogen;

The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity of at least four times a base line serum immunoreactivity of at least four times a base line serum with respect to the disorder. The prognosis of improved status with respect to the disorder. The pharmaceutical compositions of the invention are useful for treating a wide variety of disorders characterised by amyloid fibril deposition in a patient. Such disorders include Alzheimer's disease characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amyloid disease; amyloid fibril deposition; amyloid plaque; immunogenic; antibody; vaccine; Alzheimer's disease; type 2 diabetes; reactive system amyloidosis; systemic senile amyloidosis; familial amyloid cardiomyopathy; transmissible spongiform encephalopathy; Creutzfeld-Jakob disease; Kuru, haemodialysis-asssociated beta-2-microglobulin deposition; amyloid beta peptide; universal T-cell epitope; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition comprising immunogen against amyloid component such as fibril peptide or protein, or antibody against amyloid component useful for treating amyloid diseases or amyloidoses.
endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagorytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have mostropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The
                                                                                                                                         encephalopathies (e.g. Creutzfeld-Jakob disease, Kuru) characterised by prion protein deposits and beta-2-microglobulin deposits which form as result of long term haemodialysis treatment. The present sequence represents an immunogenic fusion protein comprising an amyloid beta peptide fused to a universal T-cell epitope which may be used in a composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific
amyloid beta peptide fibril deposits; type 2 diabetes characterised by islet amyloid protein peptide (IAMP, amylin) fibrils; reactive systemic amyloidosis associated with systemic inflammatory diseases (e.g., rheumatoid arthritis, osteomyelitis, tuberculosis) characterised by AA fibrils defived from serum amyloid A protein (ApoSSA); systemic senile amyloidosis and familial amyloid cardiomyopathy characterised by ATTR fibrils derived from transthyretin (TTR); transmissible spongiform

(M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.
                                                                                                                         Gaps
methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease

Synthetic.

Pseudopeptide; immunomodulation; adjuvant; antigen presenting cell; macrophage; dendritic cell; vaccine; autoimmune disease.

Peptide comprising 4 conjugation sites for a pseudopeptide.

29-OCT-2001

```
The specification describes N-Acylated pseudopeptides, which have a neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomodulatory and adjuvant action, based on activation of antigen presenting cells of e.g. macrophages or dendritic cells), induction of differentiation of dendritic cells, induction of cytokine production and induction of dendritic cells, induction of cytokine production and induction of macuration of macuration of immunocompetent cell strains originating from hematopoeitic and lymphoid organs. They reinforce humoral and cellular immunity. They can be grafted onto antigens (to modulate immune response) or onto drugs (to improve the therapeutic activity or trageting). The pseudopeptides are thus useful in human or veterinary medicine as immunizing or are thus useful in human or veterinary medicine as immunizing or covalently bonded to) antigens for vaccination against viral, or used in therapy of certain autoimmune diseases. The perasitic/protozoal, microbial or fungal infections; incubated with blood cells ex vivo, to render the cells immunocompetent before reintroduction in vivo; or used in therapy of certain autoimmune diseases. The sendopeptides are useful as carriers for antigens or other therapeutic agents due to their ability to form non-covalent bonds via the hydrophobic or hydrophilic auxiliary spacer. The present sequence represents a peptide, which has 4 possible conjugation sites for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residues of alpha and epsilon amide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more plasmodial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QYIKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-plasmodium antibodies in blood, serum and blood-spot samples. Determination can be effected by ELISA. See also AAR14261-2, AAR14264-5 and AAR15316

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes N-Acylated pseudopeptides, which have a neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomodulatory and adjuvant action, based on activation of antigen presenting cells and adjuvant action, based on activation of antigen presenting cells and adjuvant action, based on activation of antigen presenting cells and induction of differentiation of maturation of immunocompetent cells from the preduction and induction of maturation of immunocompetent cells strains originating from hematopoeitic and lymphoid organs. They reinforce humoral and cellular immunity. They can be grafted onto antigens (to modulate immune response) or onto drugs (to improve the therappeutic activity or targeting). The pseudopeptides are thus useful in human or veterinary medicine as immunizing or diagnostic agents. Typically, the pseudopeptides are used as adjuvants or cogether with (or covalently bonded to) antigens for vaccination against viral, parasitic/protozoal, microbial or fungal infections; incubated with blood cells avivo, to render the cells immunocompetent before
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    auxiliary
                                                                                                                                                                                Pseudopeptide; immunomodulation; adjuvant; antigen presenting cell; macrophage; dendritic cell; cytokine production; immunocompetent cell; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New amphiphilic acylated pseudopeptides having a functionalized au spacer, useful as immunomodulators, e.g. as adjuvants in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diseases. The present sequence represents a peptide which may be conjugated to pseudopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunogenic branched polypeptides for antimalarial vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 100.0%; Score 112; DB 4; Length 59; Best Local Similarity 100.0%; Pred. the invention relates to a method for immunising animals (including humans) against autologous ghrelin. The method involves presenting ghrelin branched comprising a ghrelin (or sub-sequence thereof) or a ghrelin analogue comprising a ghrelin becall epitope and non-ghrelin chemical moieties to the immune compositions comprising the production of antibodies against the animal's autologous ghrelin. The invention also relates to immunogenic compositions comprising ghrelin, a ghrelin sub-sequence or a phrelin analogue of the invention; a nucleic acid analogue of the invention; a nucleic acid analogue of the invention; a modified ghrelin polypeptide capable of inducing antibodies against unmodified autologous ghrelin; and use of immunogenic compositions of the invention. The method of the invention is useful for treating, preventing or ameliorating obesity or other conditions contracterised by excess body fat deposits by downregulating ghrelin to such an extent that the total amount of body fat is significantly contracting the method may also be used for upregulating ghrelin for the contraction or amelioration of anorexia or cachexia. The method of may also be used for upregulating ghrelin for the contraction or amelioration of anorexia or cachexia. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       may also be used for treating wound or burns, in adjuvant therapy for in vitro fertilisation, and for treating ghrelin and ghrelin-receptor related cancers. The present sequence represents a ghrelin analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprising mature rat ghrelin with added epitopes used in an example of
         ghrelin; ghrelin analogue; immunogen; immunisation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunizing against autologous ghrelin in animals e.g. human beings, useful for treating obesity, by presenting ghrelin polypeptide, its subsequence or analog, to animal's immune system, for producing antibodies against ghrelin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The peptide is a specific example of highly generic immunogenic substituted lyaines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residues of alpha and epsilon anide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more groups are substituted with polypeptides consisting of one or more amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QTIRANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-plasmodium antibodies in blood, serum and blood-spot samples. Determination can be effected by ELISA. See also AAR14262 - AAR14265 and AAR15436

The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residues of alpha and epsilon anide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more palsamodial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QYIKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-plasmodium antibodies in blood, serum and blood-spot samples. Determination can be effected by ELISA. See also AAR14261 - AAR14264, AAR14266 and AAR15436
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of 1-19sine amino acid reshdues of alpha and egslibn anide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epslibn amino groups and/or (n+1)/2 of the epslibn amino groups and/or (n+1)/2 of the epslibn amino groups are substituted with polypeptides consisting of one or more paramona cid sequence corresponding to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QYTKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-Plasmodium antibodies in blood, serum and blood spot samples. Determination can be effected by ELISA. See also AAR14262 - AAR14265 and AAR15436

```
The invention relates to a method for immunising animals (including humans) against autologous ghrelin. The method involves presenting ghrelin (or sub-sequence thereof) or a ghrelin manleque comprising a ghrelin are leguence thereof) or a ghrelin moieties to the immune system, thereby inducing the production of antibodies against the animal saucologous ghrelin. The invention also relates to immunogenic compositions comprising ghrelin, a ghrelin sub-sequence or a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; wetcors and host cells comprising this nucleic acid; a method of identifying a modified ghrelin polypeptide capable of inducing antibodies against unmodified autologous ghrelin; and use of immunogenic compositions of the invention. The method of the invention is useful for treating, preventing or amelioration obseity or other conditions characterised by excess body fat deposits by downregulating ghrelin to such an extent that the total amount of body fat is significantly decreased. The method may also be used for upregulating ghrelin for the treatment, prevention or amelioration of anorexia or cachexia. The method may also be used for treating wound or burns, in adjuvant therapy for in vitro fertilisation, and for treating sphrelin and ghrelin analogue comprises. The present sequence represents a ghrelin analogue
                                          Ghrelin; autologous ghrelin; ghrelin analogue; immunogen; immunisation; anti-ghrelin antibody; obesity; anorexia; cachexia; wound; burn; adjuvant therapy; in vitro fertilisation; ghrelin-related cancer; ghrelin receptor-related cancer; anorectic; cytostatic; metabolic; immunomodulator; vulnerary; vaccine; epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunizing against autologous ghrelin in animals e.g. human beings, useful for treating obesity, by presenting ghrelin polypeptide, its subsequence or aning of animal's immune system, for producing antibodies against ghrelin.
Mature ghrelin with added epitopes (peptide 5), SEQ ID NO:17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; SEQ ID NO 17; 83pp; English.

```

the invention relates to a method for immunising animals (including humans) against autologous ghrelin. The method involves presenting the ghrelin (or sub-sequence thereof) or a ghrelin analogue comprising a ghrelin for sub-sequence thereof) or a ghrelin analogue comprising a ghrelin belongs to the immune system, thereby inducing the production of antibodies against the animal's autologous ghrelin. The invention also relates to immunogenic compositions comprising ghrelin, a ghrelin sub-sequence or a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention. The method of the invention is useful for treating, preventing or ameliorating obesity or other conditions treating, preventing or ameliorating obesity by downregulating ghrelin to such an extent that the total amount of body fat is significantly decreased. The method may also be used for upregulating ghrelin for the treatment, prevention or amelioration of anorexia or cachexia. The method may also be used for treating wound or burns, in adjuvant therapy for in vitro fertilisation, and for treating ghrelin and ghrelin-receptor related cancers. The present sequence represents a prelin analogue comprising mature ghrelin with added epitopes used in an example of the

The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                       Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ଚ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Foreeptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of

                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                  The peptide is a specific example of highly generic immunogenic substituted lysines or polylysines having a number n (where n is 1-15) of L-lysine amino acid residues of alpha and epsilon anide linkage, where (n+1)/2 of the alpha amino groups and/or (n+1)/2 of the epsilon amino groups are substituted with polypeptides consisting of one or more plasmodial B epitopes covalently bound to one or more peptides with an amino acid sequence corresponding to that of a T epitope such as FNNFTVSFWLRVPKVSASHLEA or QTIKANSKFIGITE. The branched polypeptides can be used as immunogens for preparing genetically non-restricted antimalaria vaccines and for determining anti-plasmodium antibodies in blood, serum and blood-spot samples. Determination can be effected by ELISA. See also AAR14261 - AAR14263, AAR14265 and AAR15436

                                                                                                                                                                                                                                                                        The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration in useful in the manufacture of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
reventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antiparkinsonian; antibody therapy; Lewy body; alpha-synuclein; aggregation; brain; immunogenic response; beta-amyloid; Parkinson's disease.

the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response improves motor characteristics of the patient, and the administration in useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.

Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.

Example 1; Page 101-102; 110pp; English.

The present sequence is that of AutoVac construct GDF-8 P30-2, comprising the 109 C-terminal amino acid residues of human growth differentiation actor (GDF-8) in which residues 49-69 are replaced by the promiscuous tetams toxin T-cell epitope P30 (see AAB20144). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, be used to treat human diseases such as cancer cachexia where muscle arrother all parts and producting free acceptance of the production that the GDF-8 was accounted and contents suffering from acute and chronic arrother and chronic arrother animals. heart failure

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of AutoVac construct GDF-8 F30-3B, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 84.104 are replaced by the promiscuous tetanus toxin T-cell epitope F30 (see AAB2014). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the Cterminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as F30, with minimal disturbance of the authentic 3-dimensional structure of the protein. Whuleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can be used to treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                      Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .. .78

The present sequence is that of AutoVac construct GDF-8 P30-3A, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 9-99 are replaced by differentiation factor 1 -cell epitope P30 (see AAB20144). It is an comprision to the promiscuous tetanus toxin T-cell epitope P30 (see AAB20144). It is an comparable of the invention to produce a recombinant therapeutic vaccine that can scapable of effecting down-regulation of GDF-8 in order to increase the capable of breaking autotolerance against autologous GDF-8. They comprise capable of breaking autotolerance against autologous GDF-8. They comprise capable of breaking autotolerance against autologous GDF-8. They comprise capable of breaking autotolerance against autologous GDF-8. They comprise capable of the authentic 3-dimensional structure of the native sequence is replaced by a T-cell epitope such as P30, with minimal discussion of the authentic 3-dimensional structure of the protein.

Whuleic acids encoding the GDP-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDP8 vaccines can be used for treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients cancer cachexia where muscle atrophy is pronounced and for patients
                                                                                                                                                                                                                      Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Growth differentiation factor 8; GDF-8; myostatin; tetanus toxin; T-cell epitope; down-regulation; vaccine; muscle; meat; cachexia; cardiant; human; mutant; mutein.

The present sequence is that of AutoVac construct GDF-8 P30-1, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 2-41 are replaced by the promiscuous tetanus toxin T-cell epitope P30 (see AAB20144). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can atrophy is pronounced and for patients suffering from acute and chronic heart failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                  Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.

Chimeric human IL-13 protein with tetanus toxin p30 peptide SegID 11.

(first entry)

03-JUN-2004

```
This invention relates to a novel immunogenic composition comprising an response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate chuman vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthemacia activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human IL-13 protein containing a tetanus p30 peptide (immunogen 2) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

74. .94 /note= "Tetanus toxin P30 epitope"

WO2004019979-A2

Region

11-MAR-2004.

Location/Qualifiers

Homo sapiens. Clostridium tetani. Chimeric.

Human IL-13/tetanus toxin P30 epitope immunogen 2, SEQ ID NO:11.

(first entry)

03-JUN-2004

ADL97891;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 equences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, gobbe cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive squence is the chimeric human II-13 protein containing a tetanus p30 peptide (immunogen 2) of the invention.

The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide containing at least one unmethylated CG motif and a saponin. The IL-13 minunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis.
                                                                                                                                                                                                                                                                                                                       or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a human IL-13/tetanus toxin P30 epitope immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                             Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                        The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleakin-5 (L-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live accines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric human IL-13 protein with a tetanus toxin p30 peptide SegID 13

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ð
                                                                                                                           This invention relates to a novel immunogenic composition comprising an In-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chiman vaccine. The present invention describes human chimaric IL-13 and a having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human II-13 protein containing a tetanus p30 peptide (immunogen 4) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                        New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     airway hyper-responsiveness; AHR; mucus hyper-secretion;

This invention relates to a novel immunogenic composition comprising an Imlast interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate chamman vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR).

CC mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human IL-13 protein containing a tetanus p30 peptide (immunogen 4) of the invention.
                                                                                                            New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Interleukin-13; IL-13; self immunogen; CpG oligonucleotide; saponin; asthma; chronic obstructive pulmonary disease; CoPD; atopic disorder; hayfever; contact allergy; dermatitis; vaccine; antiasthmatic; respiratory; antiallergic; dermatological; mouse; murine; T-helper epitope; tetanus toxin; P30; mutant; mutein.

The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Down-regulating interleukin 5 (IL-5) activity in humans by administ IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 124;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 124;

                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition occuprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonuclectide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a murine IL-13/tetanus toxin P30 epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                   Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                    Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                    The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IJ-5) analogues and modified IJ-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Asthma, IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Asthma, IL-5, interleukin-5, allergy, cytokine, helminthic infection, cancer, eosinophilia, vaccine, allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 112; DB 3;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or.an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention is concerned with methods of treating asthma, eosinophila, allergic trhintis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live accines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                        Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Asthma, IL-5, interleukin-5, allergy, cytokine; helminthic infection, cancer, eosinophilia; vaccine, allergic rhinitis.

Down-regulating interleukin 5 (IL-5) activity in humans by administering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analoques and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                               IL-5; interleukin-5; allergy, cytokine; helminthic infection;
eosinophilia; vaccine; allergic rhinitis.
        it is possible that they may be used in the treatment of cancer and helminthic infections

                                                                                                                                                                                                                                                            Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                          The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chimeric murine IL-13 protein with tetanus toxin p30 peptide SegID 14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 132;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

This invention relates to a novel immunogenic composition comprising an Initarleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell captiopes. Specifically, it refers to a method for producing a human chineric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chineric IL-13 sequences as having a similar conformational shape to native human IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, attributable to non-human mammalian species, to enhance its immunogenicity, accordingly, the method results in a reduction in airay hyper-responsiveness (AHR).

The airays and skin intritation, as well as reducing the requirement for inhaled corticostercids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to transmativity duals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric murine IL-13 protein with humanised amino acid inventions containing a tetanus p30 peptide (immunogen 6) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 132;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           田林なななは
                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune cresponse by recognishing human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human configuration of a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 conformational shape to native human IL-13 conhuman mammalian species, to enhance its immunogenicity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, conhuman myper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide contains of the intermise match match mitting IL-13 protein containing a tetamus p30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                            New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mouse; immunogenic; IL-13; interleukin-13; vaccine;

New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.

Disclosure; SEQ ID NO 15; 89pp; English

This invention relates to a novel immunogenic composition comprising an immune IL-13 (interleukin-13) element that is capable of driving an immune C IL-13 (interleukin-13) element that is capable of driving an immune C response by recognishing human IL-13 and one or more foreign T-cell cepttopes. Specifically, it refers to a method for producing a human C chimeric IL-13 immunogen formulated in an appropriate manner to generate the human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to travat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric murine IL-13 protein with humanised amino acid increase. invention

The vaccine composition comprises an immunosen that is capable of generating an immunos response against self interleukin-13 [L-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonuclectide containing at least one unmethylated CG motif and a saponin. The IL-13 epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a murine IL-13/tetanus toxin P30 epitope immunogen of the invention.
                                                                                                                                                                                                                                             Interleukin-13; IL-13; self immunogen, CpG oligonucleotide, saponin, asthma, chronic obstructive pulmonary disease; COPD; atopic disorder; hayfever; contact allergy; dermatitis; vaccine; antiasthmatic; respiratory; antiallergic; dermatological; mouse; murine; T-helper epitope; tetanus toxin; F30; mutant; mutein.

The vaccine composition comprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign Theipper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, ar atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a chimmeric IL-13 (comprising the human IL-13 with murine IL-13 B-cell epitopes)/tetanus toxin P30 epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Interleukin-13; IL-13; self immunogen; CpG oligonucleotide; saponin; asthma; chronic obstructive pulmonary disease; COPD; atopic disorder; hayfever; contact allergy; dermatitis; vaccine; antiasthmatic; respiratory; antiallergic; dermatological; human; mouse; murine; T-helper epitope; tetanus toxin; P30; mutant; mutein.
                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine composition useful for treating asthma, Chronic Obstructive Pulmonary Disease or atopic disorders, e.g. dermatitis, comprises immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric IL-13/tetanus toxin P30 epitope immunogen 6, SEQ ID NO:15.

                                                                                                                                                                            ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel immunogenic composition comprising an regonse by recognising human II-13 (anterleukin-13) element that is capable of driving an immune response by recognising human II-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric II-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric II-13 sequences as having a similar conformational shape to native human II-13 con-human mammallan species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiaschmatic activities, can be used via gene therapy to trave tindividuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human II-13 protein containing an N-terminal

This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune CC IL-13 (interleukin-13) element that is capable of driving an immune CC response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate CC a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity, accordingly, contravays and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive sequence is the chimeric human IL-13 protein containing non-human amino acid substitutions and an N-terminal tetanus p30 peptide (immunogen 10)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-MAR-2004
This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune response by recognishing human IL-13 and one or more foreign T-cell captopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate channer vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), the method results in a reduction in airway hyper-responsiveness (AHR), the method results in intritation, as well as reducing the requirement for the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy CC to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human IL-13 protein containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the interpretation in the containing non-human amino the containing non-human amino the containing non-human am
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                         that drives an immune response recognizing human IL-13 and foreign T-cell
epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           therapy;

This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell cepitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate channer of a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, attributable to con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in air-ay hyper-responsiveness (AHR).

The airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to travat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPP), asthma or atopic dermatitis. This polypeptide sequence is the chimeric human IL-13 protein containing non-human amino containing channers in the chimeric human IL-13 protein containing non-human amino containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing containing contai
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WO2004019975-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-MAR-2004.
       This invention relates to a novel immunogenic composition comprising an IL-13 (interleutin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 equences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-thuman mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive sequence is the chimeric human IL-13 protein containing an N-terminal equations, as all the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        airway hyper-responsiveness; AHR; mucus hyper-secretion;

This invention relates to a novel immunogenic composition comprising an Interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell cepitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate chimeric IL-13 immunogen formulated in an appropriate manner to generate concument vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 con-human mammalian species, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithalial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasehmmaic activities, can be used via gene therapy to transel individuals suffering from or susceptible to chronic obstructive contractions in along and an IL-13 protein containing non-human amino containing non-human amino containing in the chimeric human IL-13 protein containing non-human amino containing and an N-terminal tetanus p30 peptide (immunogen 9) of
                                                                                                                                                                                          Chronic obstructive
                                                                                                                                                                              New vaccine composition useful for treating asthma, Chronic obstructipulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure, SEQ ID NO 18; 89pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immunos response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD,

```
The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immune response against self interleukin-13 [L-13] and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a human IL-13-derived immunogen of the invention which comprises human IL-13 immunogen 1 (ADL97933 and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition or comprises an immunogen that is capable of generating an immune response against self interleukin-13 (IL-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide containing at least one unmethylated CG motif and a saponin. The IL-13 finunogen is prefetably a human IL-13 backbone substituted with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allergies or dermatitis. The present sequence represents a human IL-13/tetanus toxin P30 epitope

The invention relates to a novel pharmaceutical composition for preventing or treating a disease characterised by amyloid fibril deposits (amyloid plaques) in a patient. The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the component. The invention also relates to a method for determining the involves measuring a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a component. The involves measuring a patient serum immunoreactivity of at least contracted amyloid component. A patient serum immunoreactivity of at least contracted amyloid compositions of the invention are useful for treating a prognosis of improved status with respect to the disorder. The prognositions of the invention are useful for treating a vide variety of disorders include Alahaimer's disease characterised by amyloid beta peptide fibril deposits; type 2 diabetes characterised by amyloid beta apptide fibril deposits; type 2 diabetes characterised by amyloid obst associated with systemic inflammatory diseases (e.g., captified from serum amyloid A protein (ApoSSA); systemic senile amyloid arthritis, osteomyelitis, tuberculosis) characterised by Attibula derived from serum amyloid A protein (ApoSSA); systemic senile composition and beta-2-microglobulin deposits which form as a creephalpopaths as (Eurl Appasant) fusion protein deposits; and beta-2-microglobulin deposits which form as a center and beta-2-microglobulin deposits which form as a composition to treat or prevent Alzheimer's disease. (Updated on 11-SEP-CCC 2003 to standardise Os field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition comprising immunogen against amyloid component such as fibril peptide or protein, or antibody against amyloid component useful for treating amyloid diseases or amyloidoses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Page 46; 140pp; English.

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated thus raturovaccines nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention is concerned with methods of treating asthma, eosimophilia, allergic rinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of canner and

                                                                                                                                                                        The invention provides carrier proteins comprising at least 5 CD4+ T cell epitope. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonucleotide molecules that encode peptide epitopes; (b) annealing the oligonucleotides to form duplexes; (c) introducing the duplexes into an expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a culture of the host cells. The carrier protein can be used as a protective immunogen in the control of diseases caused by encapsulated bacteria. The present sequence represents the amino acid sequence of N6 polyepitope carrier protein construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                              Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Asthma, IL-5; interleukin-5; allergy, cytokine, helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
            The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases.                     AAW81335
                                        The present sequence represents a modified human tumour necrosis factoralpha analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beta-sheet, any of the connecting loops or any of the B', I or D strands in the back beta-sheet. The TNF-alpha analogues are used as vaccines for treatment or prevention of alpha analogues are used as vaccines for treatment or prevention of thematoid arthritis, Crohn's disease, ulcerative colitis, cancer of any capture. Sort, disseminated sclerosis, diabetes, psoriasis, osteoporosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modified human tumour necrosis factor-alpha - comprises immunodominant T cell epitope, useful in vaccines to treat or prevent TNF-associated diseases, e.g. cancer.
                                                                                                                                                                                                                                                                                                   Human tumour necrosis factor-alpha; TNF-alpha; TNF-alpha analogue; vaccine; rheumatoid arthritis; Crohn's disease; ulcerative colitis; cancer; disseminated sclerosis; diabetes; psoriasis; osteoporosis;

The present sequence represents a modified human tumour necrosis factoralpha analogue. The analogues have no residual TMF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TMF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TMF alpha, has at least one fragment of TMF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TMF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beta-sheet, any of the connecting loops or any of the B', I or D strands in the back beta-sheet. The TMF-alpha analogues are used as vaccines for treatment or prevention of alpha analogues are used as vaccines for treatment or prevention of rheumatoid arthritis, Crohn's disease, ulcerative colitis, cancer of any contains and substitutions and substitutions, diabetes, psoriasis, osteoporosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a modified human tumour necrosis factoralpha (TNF-alpha) analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the B.T. or D strands in the back beta-sheet, The TNF-alpha analogues are used as vaccines for treatment or prevention of diseases associated with excessive release or activity of TNF-alpha, e.g. chumatoid arthritis, Croh's disease, ulcerative colitis, cancer of any ever

The present sequence represents a modified human tumour necrosis factoralpha (TNF-alpha) analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodeminant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beta-sheet, any of the connecting loops or any of the strands in the front beta-sheet. The TNF-loppa analogues are used as vaccines for treatment or prevention of diseases associated with excessive release or activity of TNF-alpha, e.g. rheumatoid arthritis, Crohn's disease, ulcerative colitis, cancer of any collicia contains and collicia contains and collicia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified human tumour necrosis factor-alpha - comprises immunodominant cell epitope, useful in vaccines to treat or prevent TNF-associated diseases, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention provides a pharmaceutical vaccine composition (I) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one modified immunogenic self-protein (selected from modified TNF-alpha proteins) and a surfactant capable of acting as a solubilizer. (I) is useful for preventing or treating a self-protein-mediated pathology such as an inflammatory disease, rheumatoid architis, an inflammatory bowel disease (ulcerative colitis or Crohn's disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (I) is useful for inducing autoantibodies to a self-protein such as TNF (tumour necrosis factor)-alpha in a human subject. (I) comprising cetylpyridinium chloride as a component is useful for immunisation of a human subject or for treatment of a human inflammatory disease. The present sequence represents a human TNF-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TNF-alpha; pharmaceutical; vaccine; self-protein; tumour necrosis factor; ectylpyridinium chloride; immunisation; antiinflammatory; antiheumatic; antiarthritic; antiulcer; cytostatic, antidiabetic; antipporiatic; antisathmatic; immunomodulator; neuroprotective; osteopathic; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a modified human tumour necrosis factoralpha analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beta-sheet, any of the connecting loops or any of the B', I or D strands in the back beta-sheet. The TNF-alpha analogues are used as vaccines for treatment or prevention of alpha analogues are used as vaccines for treatment or prevention of theumatoid arthritis, Crohn's disease, ulcerative colitis, cancer of any cant, disseminated sclerosis, diabetes, psoriasis, osteoporosis and

prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one modified immunogenic self-protein delected from modified TNF-alpha proteins) and a surfactant capable of acting as a solubilizer. (I) is useful for preventing or treating a self-protein-mediated pathology such as an inflammatory disease, rheumatoid disease, cancer, cachexia, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (I) is useful for inducing autoantibodies to a self-protein such as TNP (tumour necrosis factor)-alpha in a human for immunisation of a human subject or for treatment of a human analogue TNF-alpha analogue TNF-alpha
Novel vaccine composition for prevention/treatment of self-protein-mediated pathology such as cancer, diabetes and asthma, comprises modified immunogenic self-protein and surfactant capable of acting
                                                                                                                                                                                                                                                                                                                               The invention provides a pharmaceutical vaccine composition (I)
                                                                                                                                                                                                                                 Claim 21; Page 42-43; 55pp; English.

                                                                                                                                                                                                                    The invention provides a pharmaceutical vaccine composition (1) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one modified immunogenic self-protein composition comprises at least one modified immunogenic self-protein acting as a solubilizer. (1) is useful for preventing or treating a self-proteins, an inflammatory bowel disease (ulcerative colitis or crohn's arthritis, an inflammatory bowel disease (ulcerative colitis or Crohn's disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, self-protein such as TMF (tumour necrosis factor) -alpha in a human subject. (1) comprising cetylpyridinium chloride as a component is useful for immunisation of a human subject or for treatment of a human inflammatory disease. The present sequence represents a human TNF-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Novel vaccine composition for prevention/treatment of self-protein-mediated pathology such as cancer, diabetes and asthma, comprises modified immunogenic self-protein and surfactant capable of acting as solubilizer.

Claim 21; Page 33-34; 55pp; English.

The invention provides a pharmaceutical vaccine composition (I) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one medifiled immunogenic self-protein (selected from modifiled TNR-alpha proteins) and a surfactant capable of acting as a solubilizer. (I) is useful for preventing or treating a self

inflammatory disease. The present sequence represents a human ${\tt TNF-alpha}$ analogue ${\tt TNF30-4}$

ö
-protein-mediated pathology such as an inflammatory disease, rheumatoid arthritis, an inflammatory bowel disease (ulcerative colitis or Crohn's disease), cancer, cachesia, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (I) is useful for inducing autoantibodies to a self-protein such as TNF (tumour necrosis factor)-alpha in a human subject. (I) comprising octylpyridinium chloride as a component is useful for immunisation of a human subject or for treatment of a human inflammatory, disease. The present sequence represents a human TNF-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a pharmaceutical vaccine composition (1) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one modified immunogenic self-protein (selected from modified TNP-alpha proteins) and a surfactant capable of acting as a solubilizer. (1) is useful for preventing or treating a self-protein-mediated pathology such as an inflammatory disease, theumatoid arthitis, an inflammatory bowel disease (ulcerative colitis or Crohn's disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (1) is useful for inducing autoantibodies to a self-protein such as TNF (tumour necrosis factor)-alpha in a human subject. (1) comprising cetylphyridinium chloride as a component is useful for immunisation of a human subject or for treatment of a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        INF-alpha; pharmaceutical; vaccine; self-protein; tumour necrosis factor; ectylpyridinium chloride; immunisation; antidiclammatory; antirheumatic; antiatrhritic; antinicer; cytostatic; antidabetic; antipsoriatic; antidathmatic; immunomodulator; neuroprotective; osteopathic; human;

AAB20144) and residues 37-51 substituted by tetanus toxin T-cell epitope P2 (See AAB20143). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking animals. The vaccines (see AAB20145-53) are capable of breaking cutoclerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the replaced by a T-cell epitope such as P30, with minimal disturbance of the CDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at the need for antibiotic feed-additives. Anti-GDF8 vaccines can be used to treat human diseases such as cancer cachexia where muscle ears to pronounced and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                         ó
